"Effect of Expansion and Vacuum Annealing on Residual Stresses in Welded  
OT4-1 Alloy Joints"

Moscow, Svarochnoye Proizvodstvo, No 2(460), Feb 73, pp 35-36

Abstract: The effect of expansion and vacuum annealing on residual stresses of the first and second types across the weld seam and over the thickness of the weld seam were investigated on specimens of 2-mm-thick OT4-1 alloy sheet material. The stress distributions are analysed by reference to diagrams. Tensile stresses of the first type act in the metal of the seam immediately after welding; they are maximum on the initial metal -- seam boundary and they change to compression stresses 6 mm from the seam center. Expansion decreases of the first type, and vacuum annealing eliminates them completely. Residual stresses of the second type on the order of 10 kg/mm<sup>2</sup>, act immediately after welding in the weld joint; the microstresses of the weld joint are only slightly affected by expansion, but they decrease significantly with vacuum annealing. The decrease of residual stresses as a result of expansion and vacuum annealing decreases the tendency of welded joints to develop cracks. Four figures, three bibliographic references.

"Structure and Properties of OT4 and OT4-1 Alloys Following Vacuum Annealing"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 5, 1972, pp 6-10.

Abstract: Removal of hydrogen from a metal by vacuum annealing is the most radical means of preventing hydrogen embrittlement. However, the surface of vacuum-treated metal is quite active and interacts with water vapor even at room temperature. The present article studied the influence of temperature and duration of vacuum annealing on the structure and properties of OT4 and OT4-1 alloys. The chemical composition of the alloys corresponded to the technical conditions. The studies were performed using bars 15 mm in diameter and sheets 1-3 mm thick. It was found that vacuum annealing does decrease hydrogen embrittlement of OT4-1 alloy. Vacuum annealing improves the mechanical characteristics of OT4 alloy tested with stress concentrators, but worsens the mechanical characteristics of OT4-1 alloy under these same conditions. It is recommended that vacuum annealing be performed at 670°C for two hours with subsequent oxidation of the surface of the sheets by allowing air into the system at 300-400°C.

"Influence of Hydrogen on the Structure and Properties of Titanium Alloy OT4-1"

Tr. Mosk. aviats. tekhnol. in-ta (Works of the Moscow Aviation Technological Institute), 1970, vyp. 71, pp 16-23 (from RZh-Metallurgiya, No 12, Dec 70, Abstract No 12 I779 by the authors)

Translation: Impact tests and tests according to the Troyano method (test basis: 500 days) showed that a hydrogen concentration  $< 0.005\%$  is safe for alloy OT4-1. Threshold stresses decline with an increase in hydrogen content and at concentrations of 0.02-0.1% amount to  $30 \text{ kg/mm}^2$  given a test basis of 500 days. The tendency of the alloy toward hydrogen embrittlement intensifies with a drop in test temperature. Alloy OT4-1 with an acicular structure is more prone to hydrogen embrittlement than that with a granular phase form. Eight illustrations. Bibliography of five titles.

"A Case of Isolation of *B. anthracis* From *Microtus oeconomus*"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 5, May 71,  
p 144

Abstract: Meadows surrounding the Uda River in Nizhneudinskiy Rayon have well-drained soil, are covered with various types of grass, and are bordered with willow groves along the river banks. In August 1967, during a routine inspection of the rodents inhabiting these meadows, seven field mice and five root voles (*Microtus oeconomus*) were caught. Tissue samples for bacteriological investigations were collected in a sterile manner, separately from mice and voles, and were stored in a preservative (glycerine and distilled water) in a cool place. Bioassays were performed in September. White mice receiving liver and spleen homogenates from the field mice developed no pathology. However, white mice given similar homogenates from the root voles died, and the anthrax bacillus was isolated from them. The conclusion is drawn that meadows along the Uda River have local foci of anthrax bacilli, whose spores survive in the soil and are ingested by the voles together with plant roots and bulbs.

"Determining the Radiation Power of a Plasma from Nonconducting Materials"

Minsk, Zhurnal Prikladnoy Spektroskopii, Vol. 12, No. 1, Jan 1970, pp 8-12

Abstract: The basic difficulty in the way of obtaining quantitative data concerning the radiation of a low-temperature plasma from nonconducting materials is getting a plasma with a controlled chemical composition, pressure, and temperature. A more promising plasma source is a powerful discharge pressed against a dielectric wall by a magnetic field specially developed for this purpose. The paper discusses this better method of producing a plasma, known as the H-pressed discharge method. It begins with an examination of the correspondence between the atomic chemical state of the plasma and the vaporized nonconducting material against which the discharge is pressed. Under the condition of the H-pressed discharge method the plasma is characterized by a quasi-stationary, stable radiation; temperature uniformity along the discharge axis; and known values of temperature 1/2

and pressure. Hence, the use of such a source for the study and measurement of the radiative power from a plasma of various materials is the most promising. The authors describe measurements they made of the radiating capability of such plasmas; their method was the ballistic method, in which a vacuum inertial thermocouple combined with a mirror galvanometer or a photoelectric amplifier is used as the radiation energy sensor.

ABSTRACT. THE ANALYTICAL REPRESENTATION OF THE GEOMAGNETIC FIELD IS CLOSELY RELATED TO THE PROBLEMS INVOLVED IN MAGNETIC CARTOGRAPHY. IT CAN BE USED BOTH FOR REPRESENTING THE MAIN MAGNETIC FIELD AND AS A NORMAL FIELD FOR STANDARDIZING MAPS OF MAGNETIC ANOMALIES. THE PROBLEM OF THE NORMAL FIELD IN GENERAL AND THE NORMAL FIELD REPRESENTED BY SPHERICAL HARMONIC SERIES HAS BEEN DEVELOPED IN DETAIL BY BULLARD. THIS ARTICLE IS A FURTHER DEVELOPMENT OF SOME OF HIS CONCLUSIONS, WITH WHICH THE AUTHORS ARE IN GENERAL FULLY IN AGREEMENT. AS THE OBSERVED FIELD THE AUTHORS USED THE RESULTS OF SURVEYS OF THE MODULUS OF TOTAL STRENGTH  $T$ , FREED FROM THE EFFECT OF LOCAL ANOMALIES. THE ONLY SURVEYS EMPLOYED WERE THOSE MADE WITH PROTON MAGNETOMETERS DURING THE LAST 5-10 YEARS. ALL THE EXPERIMENTAL DATA FELL INTO TWO CATEGORIES: 1) MEASUREMENTS OF  $T$  ALONG MOST GROUND, OCEAN AND AEROMAGNETIC PROFILES, REDUCED TO 1965 AND THE EARTH'S SURFACE. CONTINUOUS  $T$  MEASUREMENTS ALONG THE PROFILES WERE FIRST SUBJECTED TO MOVING AVERAGING WITH A BASE OF 400 KM AND A 5 KM INTERVAL; 2) MAPS OF NORMAL FIELDS OF EXTENSIVE REGIONS COMPILED BY DIFFERENT METHODS USING SURVEY DATA FOR THESE REGIONS. THE ACCURACY OF  $T$  VALUES IS ESTIMATED FOR DIFFERENT REGIONS FROM 15 TO 50 GAMMA. FIG. 1 IN THE TEXT SHOWS THE GEOGRAPHICAL DISTRIBUTION OF PROFILES AND THE AREAS COVERED BY REGIONAL MAPS. FIGS. 2 AND 3 SHOW  $\Delta T$  CURVES, THE DIFFERENCES BETWEEN OBSERVED AND ANALYTICAL  $T$  VALUES. IT IS SHOWN THAT ANALYTICAL EXPRESSION OF THE FIELD REPRESENTED BY THE SUM OF NINE HARMONICS CAN BE USED AS THE NORMAL FIELD.

EFFECT OF SYNTHETIC CARBOHYDRATES ON RAT LIVER LYSONOMES

[Article by G. F. Shchegoleva, Yu. Ye. Sinyak and V. I. Gorshkova, Moscow, Rossiyskaya Biologiya i Meditsina, Moscow, Vol. 6, No. 2, March-April 1972, pp 29-31, submitted for publication 17 July 1970]

**Abstract:** The effect of synthetic carbohydrates on rat liver lysosomes was examined. Since the carbohydrates were purified from contaminants they lost their toxicity for lysosomes.

One of the most important problems in medicine is the regeneration of food substances from the products of man's vital functions during prolonged space flights. In the laboratory carbon dioxide can be utilized through the stage of formaldehyde condensation, leading to the formation of 10-13 optically inactive monosaccharides, primarily pentoses and hexoses (Paterewski, Abello, Fiedl and Becker; A. M. Kurin; Yu. Ye. Sinyak and V. A. Uspenskaya). It is not imperative that the isomers of carbon dioxide obtained as a result of this synthesis can serve as one of the sources of a diet for cosmonauts. Accordingly, it was necessary to conduct a toxicological investigation of these carbohydrates.

The toxicity of synthetic carbohydrates was studied in rat liver lysosomes, ultrafine structures of the cell membrane from 0.2 to 0.8  $\mu$  containing hydrolytic enzymes. Cell lysosomes are morphologically separated by a lipoprotein membrane. An increase in permeability or the destruction of this membrane leads to a freeing of the enzymes, an increase in their activity in the cell, and therefore to one pathological state or another. Among the factors increasing the entry of lysosomal enzymes into the cell are many toxins, vitamins, antibiotics, exposure to transverse ionization, etc. (Kernheimer and Schwartz; Tarnavski; A. M. Kharitonova and A. A. Avakyan; Kh. Kh. Hanel' yes, et al.). It was precisely the high sensitivity of lysosomes to exposure to different factors and their role in processes of a pathological or physiological dying out of cells that was the basis for selecting lysosomes as an object for studying the toxicological effect of synthetic carbohydrates.

STUDY OF THE GAS EXHAUSTION OF A NUMBER OF POLYMERS DURING  
THEIR PROLONGED STORAGE

Article by A. I. Gorshunova and E. I. Shadrin; Chem. Zvezdy, 1969, No. 1, p. 14. (Russian).  
Annals of the Vsesoyuznyy Nauchno-Issledovatskiy Tsentr "Vostochnyye Yazyki i Literatura", Moscow, 1971,  
pp. 89-93.

The polymers used for constituting the cabin of a space-  
ship can release into the surrounding atmosphere a number of  
substances which are toxic to man. This gives rise to a neces-  
sity for studying the qualitative and quantitative characteris-  
tics of the volatile substances released by polymers and for  
predicting their gas emissions over long periods of time.

In this study we investigated the change in the quali-  
tative and quantitative composition of gaseous products ex-  
caping into the surrounding medium from polymers during their  
prolonged retention under natural conditions.

The literature contains data indicating that synthetic  
materials are a source of poisons (up to three-tenths per cent  
concentration of the atmosphere by harmful impurities) for  
Yekhnova, et al., 1969, G. N. Berman, 1967, Yekhnova, et al.,  
at M., 1969, L. N. Pichenko, et al., 1969). In addition,  
studies have been made pertaining to the dynamics of the gas  
emission process. For example, A. V. Bogov (1967, 1969) has  
shown that the dependence of gas emission of polymers on  
the time of their use usually has an exponential nature. He  
presented a formula for computing the change in concentration  
of formaldehyde in a kindergarden room during a period of  
time from nine to nineteen months after fabrication of the  
materials.

According to data published by V. Ia. Isakovskaya,  
et al. (1969), during the storage of three months after the  
fabrication of polymers there is a marked decrease in the

"Interferon Production and Nonspecific Protective Reactions in the Central Nervous System of Animals Vaccinated With Live Measles Vaccine"

Moscow, Voprosy Virusologii, No 6, Nov/Dec 71, pp 735-739

Abstract: Immunization of white mice with live measles vaccine results in a prolonged production of endogenous interferon, not only in the reticuloendothelial system but also in other organs. Within 72 hours of immunization, interferon concentration in the spleen and the lymph nodes is higher than in the blood serum for 15 days, while in the lungs and the brain it is even higher than in the reticuloendothelial system for 30 days. It was concluded that this local production of interferon is due to the attenuated measles virus entering the various organs and persisting in them for longer periods. The vaccinated animals also display an augmented, nonspecific resistance to intracerebral inoculation with neurovirulent herpes virus, which must be due to nonspecific protective reactions developing in the CNS in association with the local production of interferon.

"Changes in Sensitivity of the Organism to Heterologous Viral Infections After Immunization by Various Virus Vaccines. Report I. The Capacity of Live Polio-vaccine and Vaccine Against Tickborne Encephalitis to Generate Resistance to Heterologous Viral Infections"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, Vol 47, No 6,  
Jun 70, pp 83-86

Abstract: In recent years, it has been established that vaccination enhances the sensitivity of the organism to various infections and toxic agents. White mice and rats were used in experiments to establish the extent to which live poliovaccine enhances antiviral resistance. After intramuscular vaccination, the test animals were infected with tickborne encephalitis virus or rabies virus. In the first test series, it was established that seven days after vaccination, the resistance of animals to tickborne encephalitis virus was increased. The death rate of mice in this series was 20% whereas that of control animals was 45%. Resistance increased up to the 20th day; by the 30th day resistance decreased and was almost at the initial level. The resistance to rabies was still high in white mice and rats for 45-60 days after injection of poliovaccine. The mortality rate was nine times  
1/2

USSR

GORSHUNOVA, L. P. and NABOKOVA, A. V., Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, Vol 47, No 6, Jun 70, pp 83-86

lower than that of controls. By the 90th day, resistance dropped somewhat, but was still considerably higher than that of unvaccinated animals. In a third test series, it was shown that immunization of white mice with inactivated vaccine against tickborne encephalitis in combination with live poliovaccine increased the resistance to rabies. This was observed for the 15th through the 60th day after vaccination. The rabies mortality of animals vaccinated against tickborne encephalitis was 2-4 times lower than that of controls. The data obtained show that immunization by live poliovaccine and inactivated vaccine against tickborne encephalitis enhances the resistance of the organism to heterologous viral infections. The level and duration of this resistance are determined by the properties of the vaccine preparation used, and by the features of the particular heterologous virus infection.

"Measurement of Magnetic Induction During Pendulum Oscillations of  
Magnetometer Measurement Transformer"

Moscow, Metrologiya, 1973, No 4, pp 73-79

Abstract: The subject magnetometer consists essentially of a pendulum oscillating in the magnetic field to be measured. The voltage generated in a coil mounted on the pendulum is proportional to the magnetic field. Three problems related to this magnetometer are solved: 1. With the pendulum oscillating in the plane of the magnetic meridian, the mean voltage for one period of oscillation is derived, the expression of errors committed by averaging the voltage for a fraction of a period is given. 2. The effect of the magnetic moment of the magnetometer base is analysed. 3. The effect of oscillations of the magnetometer base is investigated.

"Estimate of the Accuracy of Calculation of One Class of Nonmonotonic Correlation Function"

Tr. Vses. Zaoch. Mashinostroit. In-ta [Works of All-Union Correspondence Institute of Machine Building], 1973, No 5, pp 5-9 (Translated from Referativnyy Zhurnal Kibernetika, No 9, 1973, Abstract No 9V170)

Translation: Suppose  $\xi(t)$  is a stable random process with mathematical expectation  $m$  and correlation function  $K(\tau)$ , the realizations of which can be observed over a time interval of length  $T$ . Suppose further,

$$K(\tau) = D\theta(\tau) \cos 2\pi f\tau.$$

$$\theta(\tau) = \begin{cases} \frac{1}{\gamma-1} [\gamma e^{-\alpha|\tau|} - e^{-\alpha\gamma|\tau|}], & \gamma > 1, \\ [1 + \alpha|\tau|] e^{-\alpha|\tau|}, & \gamma = 1, \end{cases}$$

$$\bar{\mu} = \frac{T-\tau}{\tau_0}, \quad \bar{\tau} = \frac{\tau}{\tau_0}, \quad \bar{f} = f\tau_0,$$

where  $\tau_0$  is the solution of the equation  $\theta(\tau_0) = 0.95$ . An approximate formula is presented for calculation of the dispersion  $\sigma^2(\bar{\mu}, \bar{\tau}, \bar{f}, \gamma, \alpha)$  of the estimate

$$\hat{K}(\tau) = \frac{1}{T-\tau} \int_{t_0}^{t_0+\tau} [\xi(t) - m][\xi(t+\tau) - m] dt.$$

"Liberation of Organic Substances by *Chlorella pyrenoidosa* During Its Growth  
and Cell Division"

Moscow, Mikrobiologiya, Vol 14, No 1, Jan/Feb 72, pp 59-63

Abstract: The study was undertaken to clarify if *Chlorella pyrenoidosa* liberates organic substances into the medium during the rupture of cell membranes or during its growth, and to compare the composition of extracellular products at these stages of cell development. A pure strain S-39 of *Chl. pyrenoidosa* was studied. The aplanospores were inoculated into "Tamiya" medium diluted 1:4. The content of carbohydrates in the medium was calculated from changes in carbohydrate concentration during the transformation of aplanospores into the mature parent cells ready for division (i.e., during 9 hours of illumination) and during the period of two divisions in light (i.e., 11 hours of illumination). The concentration of various organic compounds was calculated also after a complete division of cells in darkness (i.e., 9 hours of illumination and 15 hours of darkness). The amount of organic substances was estimated by wet combustion with potassium persulfate at 120°C for 30 min in sealed ampules.

1/2

USSR

MAKSIMOVA, I. V., et al., Mikrobiologiya, Vol 41, No 1, Jan/Feb 72, pp 59-63

The CO<sub>2</sub> produced was estimated using gas analyzer type OA 5501. The total amount of keto acids was estimated using calorimetric measurement in the form of 2,4-dinitrophenylhydrazine. The total amount of free amino acids in the medium was tested using colorimetric estimation of alpha-amino nitrogen. The accumulation of various groups of organic compounds was associated with various stages in the life cycle of the Chlorella cells. The concentration of polysaccharides increased sharply only during reproduction of the algae. The concentration of free amino acids in the medium increased during the growth and transformation of the cells up to the beginning of the appearance of aplanospores. The concentration decreased during the transition of the algae to reproduction and during dark incubation. The concentration of keto acids in the medium increased both during growth and transformation and during the production of aplanospores from the parent cells in light. The keto acids are consumed in darkness.

"Model Sound Waves in a Wedge with the Aid of Moire Patterns"

Moscow, Akusticheskiy Zhurnal, Vol 16, No 1, 1970, pp 10-14

Abstract: Analogy modeling of the sound field in a wedge is examined with the aid of moire patterns formed by superimposing moire gratings. It is shown that moire patterns make it possible to graphically represent the vertical distribution of the field at different distances from the rib of the wedge. The question of the number of normal waves in the plane-parallel layer and the wedge which must be modeling in estimating losses accompanying the reflection of sound from the absorbing bottom was investigated.

The angle between the normal to the fronts of each of these waves and the boundary of the flat layer for the case of identical (soft or hard) absolutely reflecting boundaries is

$$\alpha_n = \arcsin \left( \frac{n\lambda}{2H} \right) \quad (1)$$

USSR

BARKHATOV, A. N., et al., Akusticheskiy Zhurnal, Vol 16, No 1, 1970, pp 10-14

where  $n$  = number of normal wave,  $\lambda$  = length of sound wave, and  $H$  = thickness of layer.

On the other hand, the period of the moire pattern  $H_M$  formed by superimposing two hatched gratings with the same period  $\lambda_M$  is determined by the formula:

$$H_M = \frac{\lambda_M}{2 \sin \alpha_M} \quad (2)$$

where  $2\alpha_M$  = angle of intersection of grating hatchings.

FOAMING AS A CONTROL FACTOR OF FERMENTATION  
R.D. Solfer, S.V. Gorskaya, T.A. Ivankova  
 National Institute for Antibiotics, Moscow, USSR

G13 6

GORSKAYA, S.V.

Intensification of antibiotic biosynthesis by the use of highly productive strains of antibiotic-producing organisms and more concentrated media usually increases foaming during fermentation. Necessity of avoiding losses due to abundant foaming of the fermentation broth stimulates actuality of studies concerning decrease of foaming and its regulation. Combination of foaming agents with substances affecting the strength of protective membranes of the foam bubbles are of special interest among means of foam breaking in the fermentation broth. It was shown that protein and other foaming agents added to the medium together with its components preserve their effect during the whole fermentation process. Interaction of the foaming agents with each other and the metabolites of the antibiotic-producing organisms may result in mutual binding of the foaming capacity. Curves of the foaming dynamics during fermentation evaluated quantitatively with a numerical criterion developed at the National Institute for Antibiotics may serve as an illustration of it. Foaming is discussed in connection with changing of a number of physical and chemical characteristics of fermentation broths; the effect of the factors concerning the inoculum and amount is shown. Studies on foaming are advisable in connection with other technological characteristics of the fermentation process (the antibiotic level in the fermentation broth, its filtration capacity and others). Mathematical dependences of foaming and streptomycin biosynthesis upon the medium content are presented. The equations of regression are interpreted graphically in plane.

GORSKAYA, S.V.

EFFECT OF BIOSYNTHESIS CONDITIONS ON FILTRATION  
CHARACTERISTICS OF FERMENTATION BROTHS

S.A. Zhukovskaya, S.V. Gorskaya

National Institute for Antibiotics, Moscow, USSR

G10 11

The effect of main factors on filtration capacity of fermentation broths is discussed. The nature of the antibiotic-producing organism (fungi, imperfecti, actinomycetes) has the principal effect on the filtration capacity of the fermentation broth, since it defines the amount and structure of the filtration cake. Data on filtration properties of fermentation broths of various antibiotic-producing organisms are presented. It is shown that the qualitative composition of media has a significant effect on filtration of the fermentation broths. Addition of protein-containing products, such as soybean meal and others impedes the filtration. Enrichment of media with main sources of nutrition as a rule increases the amount of the filtration cake and decreases its permeability. The quantitative correlations between the component concentration in media and the filterability of fermentation broths are presented. Data on changes in the filtration characteristics of fermentation broths during fermentation are presented. Filtration capacity of the fermentation broth changes significantly in dependence on the biosynthesis duration. Dependence of filtration capacity on the content of colloids of cultural broths, such as proteins, polysaccharides, etc. in a complex nature. Such factors are not decisive. The effect of the cake structure on amount as a rule is prevailing. Preliminary treatment of the fermentation broth before the cell separation markedly changes as a rule its filtration properties. The method used for the preliminary treatment of the fermentation broth usually correlates with its filtration properties. Data on the efficacy of various clarification methods as applied to various fermentation broths are presented.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A STUDY ON MYCELIUM COMPOSITION OF ACTINOMYCES STREPTOMYCINI GROWN ON A DEFINED MEDIUM WITH GLUCOSE OR STARCH HAS SHOWN THAT THE MYCELIUM GROWN ON THE MEDIUM WITH GLUCOSE CONTAINED MORE NITROGEN AND NUCLEIC ACIDS THAN THE MYCELIUM GROWN ON STARCH. THE MYCELIUM, GROWN ON THE MEDIUM WITH STARCH, WAS ENRICHED WITH CARBOHYDRATES, ESPECIALLY WITH POLYSACCHARIDES. SINCE LESS AMOUNT OF STREPTOMYCIN WAS PRODUCED ON THE MEDIUM WITH STARCH, SOME COMPETITION CAN BE SUGGESTED TO TAKE PLACE BETWEEN SYNTHESIS OF POLYSACCHARIDES AND THAT OF ANTIBIOTIC, TAKING INTO CONSIDERATION CARBOHYDRATE NATURE OF THE LATTER.

"Change in Viscosity at the Transition Point of an Isotropic-Liquid to the Liquid-Crystal Phase"

Minsk, V sb. Kristallizatsiya i faz. prevrashcheniya (Crystallization and Phase Transformations -- collection of works) "Nauka i tekhn.," 1971, pp 5-9 (from RZh-Fizika, No 9, 1971, Abstract No 9E52)

Translation: The results are given of the measurements of the variation, with temperature, of the viscosity of cholesteryl cinnamate, cholesteryl benzoate, and cholesteryl capinate. In the neighborhood of the transition, this dependence has a  $\lambda$  shape. The jumps in viscosity at the transition point are 67, 44, and 21% respectively. The most conclusive  $\lambda$  shape of the dependence (at the elucidative point) is explained by the anisotropy of the viscosity for the elongated molecules and the appearance, in the pre-crystallization period, of ordering corresponding to the liquid-crystalline state. ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS EXAMINED 351 PATIENTS WITH TUMORS OF THE EYE AND ORBIT, OF THIS NUMBER 296 WERE OPERATED UPON.

THE FIRST GROUP INCLUDED 174 PATIENTS WITH INTRACULAR TUMORS. THESE PATIENTS WERE EXAMINED WITH THE AID OF RADIOPHOSPHORUS. IN LOCALIZATION OF THE TUMOR ON THE CONJUNCTIVA AND SCLERA A COINCIDENCE OF THE RESULTS OF RADIOMETRIC INVESTIGATIONS WITH CLINICAL AND HISTOLOGICAL DATA WAS NOTED IN 90 PER CENT OF CASES, WHEREAS IN MALIGNANT MELANOMA OF THE VASCULAR MEMBRANE AND CILIARY BODY, IN 83 PERCENT AND IN MALIGNANT TUMORS OF THE IRIS, IN 71 PER CENT OF CASES. IN LOCALIZATION OF TUMORS IN THE POSTERIOR REGION OF THE EYE TRANSCONJUNCTIVAL RADIOPHOSPHORUS DIAGNOSIS WAS CARRIED OUT. THE SECOND GROUP CONSISTED OF 122 PATIENTS WITH TUMORS AND TUMOR LIKE DISEASES OF THE ORBIT AND ADJACENT REGIONS. THIS GROUP OF PATIENTS WAS EXAMINED WITH THE AID OF P PRIME32, I PRIME131, DIP AND I PRIME125. A COINCIDENCE OF DATA OF RADIOISOTOPE DIAGNOSIS WITH THE RESULTS OF CLINICAL AND HISTOLOGICAL INVESTIGATIONS FOR BENIGN TUMORS WAS 89.4 PER CENT, FOR MALIGNANT, 86.6 PER CENT OF CASES.

"An Investigation of Heat Stresses in the Turbine Body of the TKR-11 Turbo Compressor in Unstable Modes of Operation"

Chelyabinsk, S<sup>o</sup>. Nauch. Tr. Chelyabinsk. Politekhn. In-ta (Selected Scientific Proceedings of the Chelyabinsk Polytechnical Institute) No. 92, 1971, pp 106-109 (from Referativnyy Zhurnal - Turbostroyeniye, No. 9, Sep 71, Abstract No. 9.49.120)

Translation: The results of an experimental investigation of thermal stresses arising in turbine bodies under conditions close to those of use are given. At the same time the temperature fields are determined more accurately. The measurement of temperature on the surface of the turbine body was done with Chromel (chromium-nickel alloy) - aluminum thermocouples, while deformations were measured with high temperature tensometers. It was determined that significant stresses in the turbine body are not determined by the temperature drop across the thickness of the wall, but are connected with the constraint on the total deformation of the body as a result of the non-uniform distribution of temperature in connected parts (jet nozzle vane rings, central body, etc.). 2 illustrations, 5 bibliographic entries.

"Gas Flows at High Supersonic Velocity"

Kazan', Izvestiya Vysshikh Uchebnykh Zavedeniy -- Matematika, No 10, Oct 72,  
pp 18-22

Abstract: The article studies irrotational flows of an ideal gas near the maximum velocity. Approximate equations of motion are found in physical variables for the general three-dimensional, axisymmetric, and plane cases, analogous to TSIEN's equations. Certain particular solutions of these equations are obtained. Plane flows are also considered in hodograph variables. Approximate equations of motion are derived in canonical form for the stream function and velocity potential. Riemann functions are found for these equations to solve the fundamental boundary value problems, given an arbitrary value for the adiabatic exponent.

The author thanks S. V. FAL'KOVICH for his interest in the work.

242214 METAL VACUUMING ROUTINE utilises variable rarefication in the feed funnel and high residual pressure in the treatment chamber itself. Varying the residual pressure above the meniscus in the funnel and maintaining the residual pressure inside the chamber ensures smooth control of metal feed and at the same time keeps a constant metal level. Electron ring or vortex pumps are suitable, sealed to the upper lip of the funnel. This allows metal to be poured into the funnel without disturbing the residual pressure control.

"Statistical Tasks in the Development of Kinetic Experiments"

Voprosy Kibernetiki. Nekotoryye Voprosy Planirovaniya Eksperimenta [Problems of Cybernetics. Certain Problems of Experimental Planning], Moscow, 1972, pp 103-132 (Translated from Referativnyy Zhurnal Kibernetika, No 6, 1973, Abstract No 6V298, by the author).

Translation: The study of the kinetics and mechanism of complex chemical reactions is of exceptional interest today. The mathematical theory of kinetics and the mechanism of complex chemical reactions has achieved significant successes. Recent works in the area of mathematical theory have turned great attention to planning of experiments studying kinetics and the mechanism of reactions. As concerns methods of statistical processing of kinetic experiments, they have been little covered in the literature. This article presents a brief description of the most important tasks in statistical processing of experiments on the kinetics and mechanism of reactions. The paper is concerned with complex, multistage chemical reactions; however, the results produced naturally retain force in the studies of the kinetics of simple reactions.

"Study of Interactions at the Phase Division Boundary in Composite  
Materials with a Nichrome Matrix and Fibers Based on Tungsten and  
Molybdenum"

Kiev, Poroshkovaya Metallurgiya, No 2, Feb 74, pp 64-75

Abstract: This work studies the structure and phase composition of the transition zones, determination of the mechanism and kinetics of growth of interaction zones, the influence of alloy elements in the fiber and matrix on the mechanism and kinetics, the study of recrystallization in the fibers and determination of the influence of all these factors on some of the strength characteristics of fiber-reinforced materials. It is established that the phase composition of the reaction zone does not influence the quantitative relationships of layer growth. The kinetics of diffusion processes in the system studied correspond to a vacancy mechanism. The alloying elements in the fiber and matrix have

1/2

- USSR

KARPINOS, D. M., et al., Poroshkovaya Metallurgiya, No 2, Feb 74, pp 64-75

a significant influence on the parameters of layer growth. The diffusion of nickel and chromium in the fiber is rapid. Recrystallization phenomena in fibers represent one of the main causes of the reduction in strength of fiber reinforced materials during long-term operation.

"Investigation of the Stability of B-Ti and SiC-Ti Composites During Extended Vacuum Heating"

Kiev, Poroshkovaya Metallurgiya, No 9, Sep 73, pp 74-76

Abstract: The interactions of B-Ti and SiC-Ti composites were studied at 900°C in a vacuum for periods extending up to as much as 300 hours. For the titanium-boron fiber composite it was established that annealing for longer than 50 hours causes a diffusion zone to be formed with a thickness up to 5 microns, and, for a period longer than 100 hours, characteristic formations in the form of a "solar corona" appear in the structure of the layer. Data from micro-x-ray spectral analysis for a 300-hour anneal show that a rich-boron phase is formed which is very close in composition to  $TiB_2$ . A silicon carbide fiber also reacts with the titanium matrix at 900°C and 300 hours with the formation of two annular zones very close in composition and close to the composition of titanium silicide  $Ti_3Si$ . At higher temperatures a phase rich with silicon --  $Ti_5Si_3$  is formed. 3 figures, 4 bibliographic references.

"Investigation of the Compatibility of Boron Fibers With Tungsten Substrate and Titanium Matrix"

Kiev, Poroshkovaya Metallurgiya, No 11 (119), Nov 72, pp 48-53

Abstract: The reaction of boron fibers with a tungsten core was investigated at 1100°C and with a titanium matrix at 900, 1000, 1100, and 1300°C and 1, 3, 5, and 10 hrs of aging in a vacuum of  $1 \cdot 10^{-4}$  mm Hg. Metallographic methods, x-ray phase and x-ray microspectral analysis, and microhardness measurements were used for the investigation. It was established that the boron fiber reacts with the tungsten substrate at 1100°C to form the higher tungsten borides  $WB_4$  and, probably,  $WB_{12}$ . Boron fiber is stable in a titanium matrix up to 900°C; at higher temperatures, titanium borides  $Ti_2B$  and  $TiB$  are formed as a result of unipolar diffusion of boron into titanium. A comparison of results with data of other authors indicates that in the composition boron fiber - titanium matrix at 900°C a diffusion zone develops over a period of 100 hrs which has the same thickness as in 1/2

"Heat and Mass Exchange on the Surface of Fiberglass-Reinforced Graphite Materials in a High-Temperature Gas Stream"

Moscow, Izvestiya Akademii Nauk SSSR, Mekhanika Zhidkosti i Gaza, No 6, Nov-Dec 72, pp 71-87

Abstract: The mutual influence of evaporation and combustion during the destruction of fiberglass-reinforced graphite materials in a hypersonic gas stream is dealt with. It is shown that fiberglass-reinforced plastics have three regimes of destruction (ablation) when acted upon by a high-temperature airstream. In the first regime, at low rates of destruction,  $\text{SiO}_2$ ,  $\text{SiO}$ , and  $\text{CO}_2$  predominate among the components containing carbon and silicon in the composition of the gas in the boundary layer. In the second regime, at moderate rates of destruction (ablation), only  $\text{SiO}$ ,  $\text{CO}_2$ , and  $\text{CO}$  are significant among the components of the above-mentioned type. In the third regime, at high rates of ablation, the components containing the above-mentioned elements are restricted to  $\text{SiO}$ ,  $\text{CO}$ , and  $\text{Si}$ .

The features of the first regime are common to all fiberglass-reinforced plastics, and virtually do not depend upon their elementary composition.  
1/2

USSR

GORSKIY, V. V. and POLEZHAYEV?, Yu. V., Izvestiya Akademii Nauk SSSR, Mekhanika Zhidkosti i Gaza, No 6, Nov-Dec 72, pp 71-87

In the second regime of destruction, the presence of free carbon in the boundary layer brings about a sharp intensification of the evaporation of  $\text{SiO}_2$ , and the dependence of the ablation rate upon the temperature of the heated surface, starting with some specific relationship of the mainstream parameters, becomes ambiguous. The third regime of destruction takes place only in fiberglass-reinforced plastics, the carbon content of which exceeds by 25% the content of glass, by weight.

The thermal effect of the physicochemical interaction of the material with the mainstream is studied, and the relationship of the parameters of coating ablation to the destruction schemes is discussed. The influence of the composition of the material upon the basic processes of its destruction is established, 7 figures, 3 tables, 8 references.

"Construction of a High Pressure Polyethylene Gas Line Under Winter Conditions"

Moscow, Stroitel'stvo truboprovodov, No. 5, May 72, pp 24-26

Abstract: Studies have shown that pipes of high-density polyethylene can be welded at temperatures below 0°C down to an ambient air temperature of -20°C without lowering the qualities of the welded joint. It is noted that the basic factors determining the properties of a welded seam, in addition to the welding technique, are the temperature and the rate of cooling of the molten material. At a high rate of cooling and at low temperatures of the structure the seam becomes microcrystalline, with the result that there is a certain drop in the density, the yield point and the strength of the material, for example, in many experiments the density of the material reduced from 0.956 to 0.951 g/cm<sup>3</sup> and the yield point and the strength were reduced 8-10%. There is also a rise in the relative expansion of 65-80% on the average and in the shock viscosity of 20-25%.

KONCHEV, Yu. N., et al, Stroitel'stvo truboprovodov, No. 5, May 72, pp 24-26

The properties of the material change with the course of time due to continuing crystallization processes in it. The structure transforms into an equilibrium state and after 5-9 days the high-density polyethylene reestablishes its initial properties. It is recommended that the location where the welding is done be protected from wind and precipitation and that the flashing off temperature of the material be increased by 5-10% to obtain a high-quality welded joint at temperatures below zero. Individual sections of the pipe line were subjected to strength and density tests and after completion of the construction the entire line was subjected to a pneumatic test at pressures of 7.5 and 6 kilogram-force/cm<sup>2</sup>. The tests showed the high strength of the welded joints and no breakdowns in the joints or a disruption in their density was observed.

"X-Ray-Spectral Study of the Electron Structure of Nickel and  
Aluminum Atoms in the System of Binary Nickel-Aluminum Alloys"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 31, No 3,  
Mar 71, pp 634-637

Abstract: Single-phase alloys of nickel with 25, 50, 60, and 75  
at. % Al were studied. The emission K spectra of nickel and  
aluminum were studied and compared with the L spectra presented  
in the literature. The data produced indicated that the forma-  
tion of intermetallics in the nickel-aluminum system involves a signi-  
ficant redistribution of electrons between the atoms of aluminum  
and nickel. In contrast to aluminides of the first half of the  
period, nickel aluminides apparently include both covalent bonds  
and ionic bonds, the percentage of ionic bonds being quite high in  
comparison with the iron-aluminum and cobalt-aluminum systems  
studied earlier. The change in the form of the Al K $\alpha$  band in  
the nickel-aluminum system indicated that, in contrast to the

"Compounds with an  $MgCu_2$ -Type Structure in Zr-Ni and Hf-Ni Alloys"

Moscow, Izvestiya Akademii Nauk SSSR, Metally, No 2, Mar-Apr 72, pp 188-192

Abstract: The Zr-Ni systems was investigated using seven alloys containing the following amounts of nickel (at.%): 64.8, 65.5, 66.7, 67.5, 68, and 69. The Zr-Ni alloys were made by electric-arc melting of a charge consisting of zirconium iodide (99.96%) and electrolytic nickel (99.99%). Hafnium with a purity of 99.93% was used to produce the HfNi<sub>2</sub> alloy. Heat treatment of the alloys consisted of a 200-hour anneal at 900°C followed by cold water quenching. Both cast and hardened alloys were studied by methods of x-ray diffraction, microstructural, local x-ray spectral, differential thermal, and durometric analyses.

In both systems, for compositions of ZrNi<sub>2</sub> and HfNi<sub>2</sub>, compounds are formed with a structure of the type  $MgCu_2$  with lattice constants equal to 6.925 and 6.906 Å, respectively. The compound ZrNi<sub>2</sub> forms according to a peritectic reaction at 1190°C while compounds Zr<sub>2</sub>Ni<sub>5</sub> and ZrNi<sub>3</sub> form at 1265 and 1575°C. Three figures, 3 tables, 10 bibliographic references.

Translation: A study was made of the possibilities of using the means of information theory for analysis of the control of large systems in power engineering, the interrelation of the concepts of information, organization, entropy and purpose, classification of types of movement and representation of information, the possibilities of separating the basic levels of description and simulation of information processes in large systems. Organization is one of the fundamental properties of all material systems. It is proposed that various types of representation of information be characterized by the degree of elimination of disorder (the inverse of organization) of the following basic types: linear, step logarithmic and exponential. The approach to description and simulation of the information problems of functioning of artificial large systems (composition, structure and properties of various levels of abstraction of the systems,

"Extension of a Solution Based on Observations of a Sum of Weighted Independent Random Quantities"

Tr. Sib. fiz.-tekhn. in-ta pr Tomsk. un-te [Works of Siberian Institute of Physics and Technology of Tomsk University]. 1973, No 63, pp 222-226 (Translated from Referativnyy Zhurnal - Kibernetika, No 8, 1973, Abstract No 8 V174 by Ye. Troitskiy)

Translation: There are  $n$  independent random quantities  $\xi_i$  ( $i=1, \dots, n$ ), taking on values of  $+1$  and  $-1$ . When the set of conditions  $S_1$  is fulfilled  $P\{\xi_i=+1\}=p_i$ ,  $P\{\xi_i=-1\}=1-p_i$ . When the set of conditions  $S_2$  is fulfilled,  $P\{\xi_i=-1\}=p_i$ ,  $P\{\xi_i=+1\}=1-p_i$ ,  $1/2 \leq p_i \leq 1$ . Probabilities  $P_j=P(S_j)$  ( $j=1,2$ ) are known. The problem is, using the observations of the weighted sum  $\sum_{i=1}^n \xi_i f(p_i)$ , to make a decision on the present conditions  $S_1$  or  $S_2$ .

Coefficients  $f(p_i)$  must be selected in a manner which is optimal in some sense. A Bayes decision rule is studied, minimizing the mean Bayes risk  $R$ . It is shown that with sufficiently large  $N$ , coefficients  $f(p_i)=(2p_i-1)/[p_i(1-p_i)]$  minimize the Bayes Risk  $R$ .

"Optical and Photoelectric Properties of Thin Layers of Tellurium Obtained by  
Compression of a Melt"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 6, No 5, 1972, pp 976-977

Abstract: A study was made of the optical absorption and reflection spectra and the photoconductivity of model crystalline layers of tellurium in the spectral range of 2.5-15 microns at temperatures of 390°K. The studies were performed in nonpolarized light, and modulated illumination was used. The characteristic curve of the spectral distribution of the photoconductivity of thin layers of tellurium obtained by compression of a melt at 90°K is presented. Two peaks in the short-wave absorption edge region are observed. The distinguishing feature of the spectral curves of the photoresponse are the presence of a weak peak in the vicinity of 7 microns and a sharp increase in the photoconductivity in the longer wave region. Explanations are offered for these effects. The simplicity of obtaining model crystalline tellurium layers and the presence of photoconductivity in the ~3.5 and ~11 micron range make these layers prospective for the manufacture of photoreceivers to operate at the temperature of liquid nitrogen.

"Impact Ductility of a Composite Material"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 7, 1973,  
pp 36-37

Abstract: The impact ductility of an Al-Al<sub>3</sub>Ni composite was investigated on specimens of the Al-Ni eutectic alloy grown in vacuum, depending on the cross section of Al<sub>3</sub>Ni fiber. The impact ductility was found to be independent of the testing temperature and to depend on the crystallization rate. According to fractographic data, in impact bending of specimens of an Al-Al<sub>3</sub>Ni composite with great interfiber distances, the crack propagates more slowly than on specimens with small interfiber distances. This results in increased fracture of an Al-Al<sub>3</sub>Ni composite obtained at low crystallization rates. The Al-Al<sub>3</sub>Ni material possesses a low notch sensitivity; on the macrorelief of fractures of notchless specimens, local zones of brittle failure are absent. One figure, ten bibliographic references.

"Obtaining Photographic Images on Fine Films of Gallium and Indium Selenides"

Leningrad, Fizika i tekhnika poluprovodnikov, vol 6, No 6, 1972,  
 pp 1166-1168

Abstract: This paper is a sequel to an earlier article by some of the authors named above (D. N. Goryachev, et al, 4, 1970, p 1580) published in the journal named above, in which the use of thin films of lead selenides and sulphides for retaining photographic images was discussed. In the present brief communication, the possibility of getting photographic images on thin films of gallium and indium selenides, of the lesser studied class of semiconductors of the AIII-BIV type, is considered. To do this, use is made of the dependence of the oxide reproduction process speed at the semiconductor-electrolyte interface on the illumination the semiconductor is exposed to. For the experiments described in this article, polycrystals of p-type GaSe were used in films 0.6 to 0.8  $\mu$  thick as well as n-type InSe in films about one micron thick, deposited on glass substrates by sputtering in a vacuum.

ZASHCHITA OT PRONIKAYUSHCHEY RADIATSII YADERNOGO VZRYVA (Protection Against the Penetrating Radiation of a Nuclear Explosion), Moscow, Atomizdat, 1970, 150 pp, illus, bibliis, 3,050 copies printed

Presents an engineering method of designing ground structures for the protection against the penetrating radiation of nuclear explosion. Since the nuclear explosion as a source of penetrating radiation is well treated in the literature, only its general characteristics are discussed here. Imphasis is placed here on neutrons and gamma rays produced at the atmosphere-ground interface and on the penetration of radiation through the typical protective media for the geometry inherent in protective structures. The book is intended for scientific and technical personnel engaged in radiation protection work.

<u>Contents</u>	<u>Pages</u>
Foreword	3-5
Chapter 1. The Nuclear Explosion as a Source of Ionizing Radiation	6-29
Chapter 2. The Field of Neutrons and Gamma-Rays during Nuclear Explosion	30-88
Chapter 3. The Emission of Radi active Fallout	89-102

KUKHTEVICH, V. I., et al., ZASHCHITA OT PRONIKAYUSHCHEY RADIATSII YADERNOGO VZRYVA (Protection Against the Penetrating Radiation of a Nuclear Explosion), Moscow, Atomizdat, 1970, 190 pp

Chapter 4. The Passage of Neutrons Through a Shield	103-120
Chapter 5. The Passage of Beta- and Gamma-Rays Through a Shield	121-145
Chapter 6. Designing the Protection of Ground Structures Against the Radiations of a Nuclear Explosion	146-172
Appendix. 10 Tables on barrier penetration of total dose of neutrons and gamma rays for various materials, and on yield of capture gamma radiation	173-188

GORYACHEV, L. V.

"Transient Processes in a Probe Pulse Shaper Circuit"

Tr. Gor'kov. politekhn. in-ta (Works of Gor'kiy Polytechnical Institute),  
1970, 26, No 7, pp 14-15 (from RZh-Radiotekhnika, No 2, Feb 71, Abstract  
No 2G240)

Translation: The author discusses the oscillations at the peak of a voltage drop which take place when shaper circuits based on semiconductor diodes with charge accumulation are used to produce pulses in the nanosecond range. An equation is derived which is used as a basis for determining the conditions for producing a transition without oscillations. Bibliography of two titles. N. S.

"A Noncontact, Magnetically Controlled Diode"

V sb. Novyye beskontaktn. elektron. ustroystva. Ch. 1 (New Noncontact Electronic Devices--collection of works. Part 1), Moscow, 1970, pp 26-31 (from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 11, Nov 70, Abstract No 11A26)

Translation: The authors present the characteristics and describe some designs of ferros whose principle of operation is analogous to that of a transformer with magnetization. A closed ferrod on a frame core made up of two L-shaped plates with a nonferromagnetic gap has low scatter of the output characteristics and high sensitivity. A ferrod designed on the basis of using a permanent magnet has inverse characteristics. A device with similar characteristics is a magnetically controlled diode designed around a standard ferrite bead with rectangular hysteresis loop located in the opening of a metallic magnetic circuit. Six illustrations, bibliography of four titles. Yu. Kh.
